## Auto-graded Task 1

This approach makes use of Bootstrap: a popular CSS library to style an HTML page. Bootstrap speeds up the development process significantly by providing pre-designed components and utilities that can be utilised simply by adding the relevant classes to each element. Bootstrap leverages both Flexbox and Grid layout, offering flexibility in structuring content and achieving responsive designs. Flexbox, a one-dimensional layout model, is used for managing the alignment and distribution of items within a single dimension, whether it's a row or a column. The Grid system, a two-dimensional layout model, offers control over both the rows and columns simultaneously by placing items inside cells defined by a grid, enabling the creation of grid-based layouts. These approaches provide an easier way to style the online CV. Remember to copy the entire bootstrap CDN link and to add it to the head section of your HTML file in order for the styles to take effect.
